

**A System and Method for Performing Predictive File Storage Management****Abstract of the Disclosure**

The present invention provides a method and system for storing information into a  
5 folder/location using a predictive function to select the name for the newly stored  
information. The predictive functions use names of applications, documents or words  
within these items to select and present a name to a user. The present invention  
introduces a new function within document processing applications, (also potentially  
operating systems), whereby each time a document is saved to a storage medium, a  
10 predictive function will cause the selection of the most probable folder/location in which  
the document would be stored.
